Part C:

Suggestion	Priority Level	AI Assessment (Perplexity)	Final Rationale & Context
Validate non-negative days (`daysLate >= 0`)	Essential	Essential, because negative days make no sense in a library fine system.	A book can't be returned negative days late. Without checking this, the program might calculate a negative fine and basically pay the user.
Check for invalid input / non-integers	Essential	Essential, as invalid characters set the stream fail bit and need proper cleanup.	If someone types letters like "abc", `cin` breaks immediately. If you don't clear the stream and ignore the rest of the line, the loop just runs forever.
Use `constexpr int` instead of a hardcoded 5	Optional	Recommended for maintainability, but it doesn't break program correctness.	Having a named variable like `FINE_PER_DAY` is clean code and makes it easy to update the rate later, but hardcoding `5` still runs without any runtime bugs.
Use `int` instead of `double`	Optional	Optional/recommended since whole days and currency units don't need decimals.	Integers prevent weird floating-point precision quirks, and days late are usually whole counts anyway. But using `double` wouldn't crash the calculation.
